What is JavaScript & What Can It Do?

Client-Side Scripting

What is JavaScript & What Can It Do?

JavaScript's History

- JavaScript was introduced by Netscape in their Navigator browser back in 1996
- JavaScript that is supported by your browser contains language features
 - not included in the current ECMAScript specification and
 - missing certain language features from that specification

The latest version of ECMAScript is the Sixth Edition (generally referred to as ES6 or ES2015).

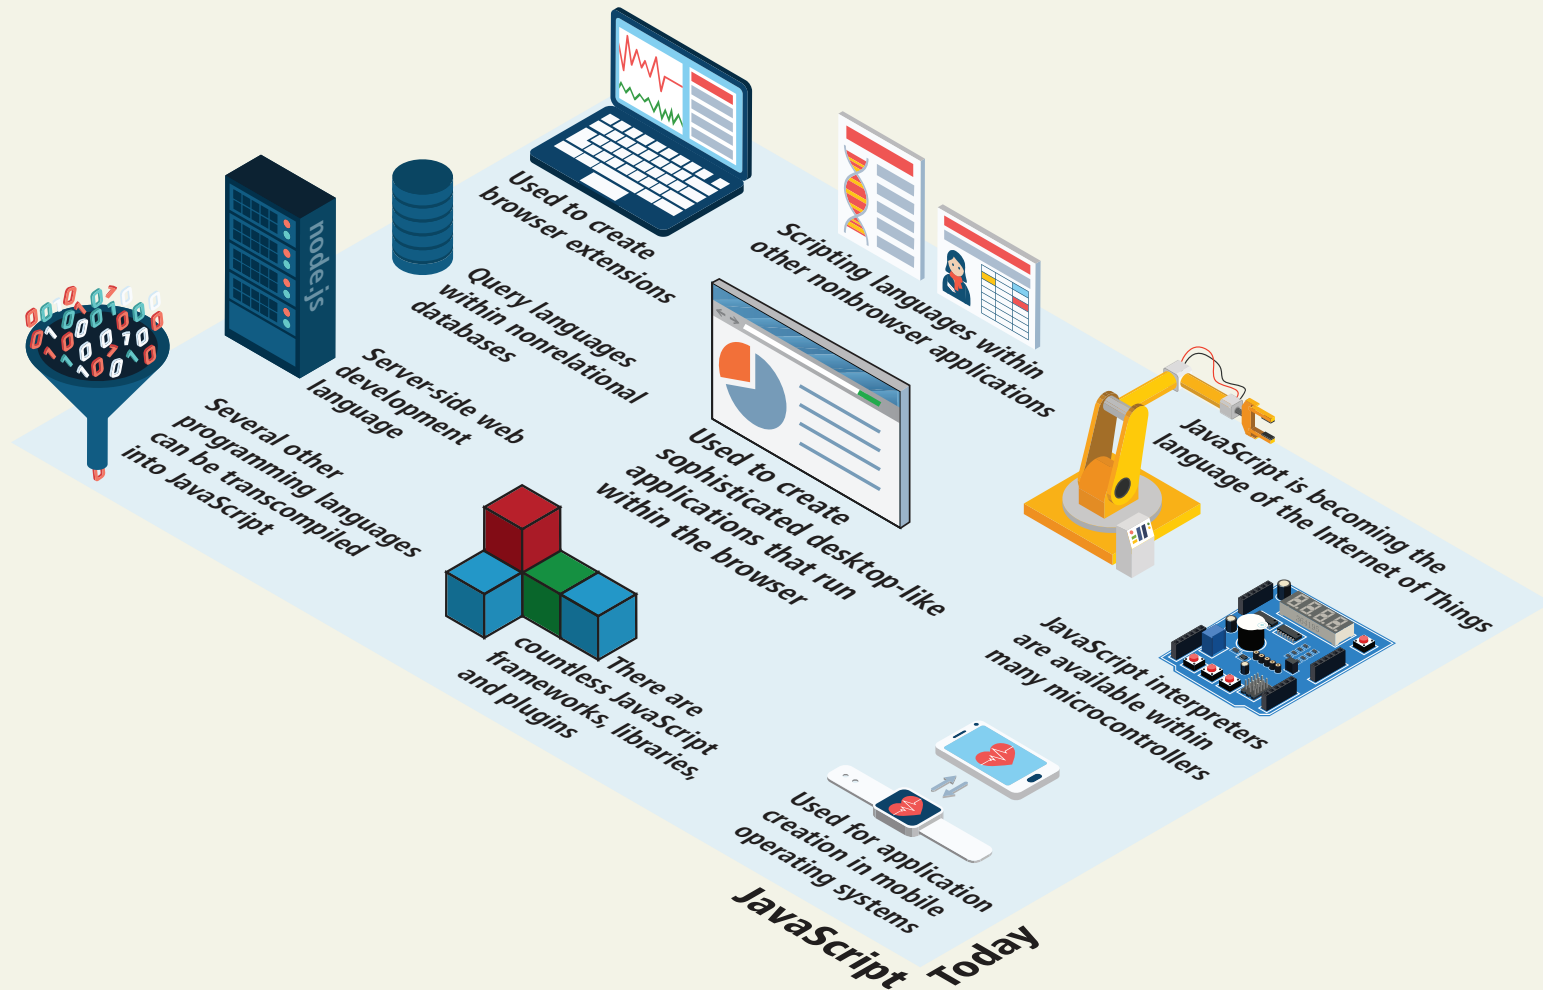

What is JavaScript & What Can It Do?

JavaScript and Web 2.0

- Early JavaScript had only a few common uses:
 - 2000s onward saw more sophisticated uses for JavaScript
 - **AJAX** as both an acronym and a general term
 - Chapters 10 and 19 will cover AJAX in much more detail.
-

Where Does JavaScript Go?

Inline JavaScript

Inline JavaScript refers to the practice of including JavaScript code directly within certain HTML attributes

```
<a href="JavaScript:OpenWindow();">more info</a>
```

```
<input type="button" onClick="alert('Are you sure?');" />
```

Where Does JavaScript Go?

Embedded JavaScript

Embedded JavaScript refers to the practice of placing JavaScript code within a `<script>` element

```
<script type="text/javascript">
```

```
    /* A JavaScript Comment */
```

```
    alert("Hello World!");
```

```
</script>
```

Where Does JavaScript Go?

External JavaScript

external JavaScript files typically contain function definitions, data definitions, and entire frameworks.

```
<head>
```

```
  <script type="text/javascript" src="greeting.js"></script>
```

```
</head>
```

Where Does JavaScript Go?

Users without JavaScript

- Web crawler
 - Browser plug-in.
 - Text-based client.
 - Visually disabled client.
 - The <NoScript> Tag

Variables and Data Types

Variables in JavaScript are **dynamically typed**

This simplifies variable declarations, since we do not require the familiar data-type identifiers

Instead we simply use the **var** keyword

Variables and Data Types

Example variable declarations and Assignments

Defines a variable named `abc`

```
var abc;
```

Each line of JavaScript should be terminated with a semicolon

```
var def = 0;
```

← A variable named `def` is defined and initialized to `0`

```
def= 4 ;
```

← `def` is assigned the value of `4`

Notice that whitespace is unimportant

```
def =  
"hello" ;
```

← `def` is assigned the value of `"hello"`

Notice that a line of JavaScript can span multiple lines

Variables and Data Types

Data Types

two basic data types:

- reference types (usually referred to as objects) and
- primitive types

Primitive types represent simple forms of data.

- **Boolean, Number, String, ...**
-

Variables and Data Types

Reference Types

```
var abc = 27;  
var def = "hello";  
  
var foo = [45, 35, 25];  
  
var xyz = def;  
var bar = foo;  
  
bar[0] = 200;
```

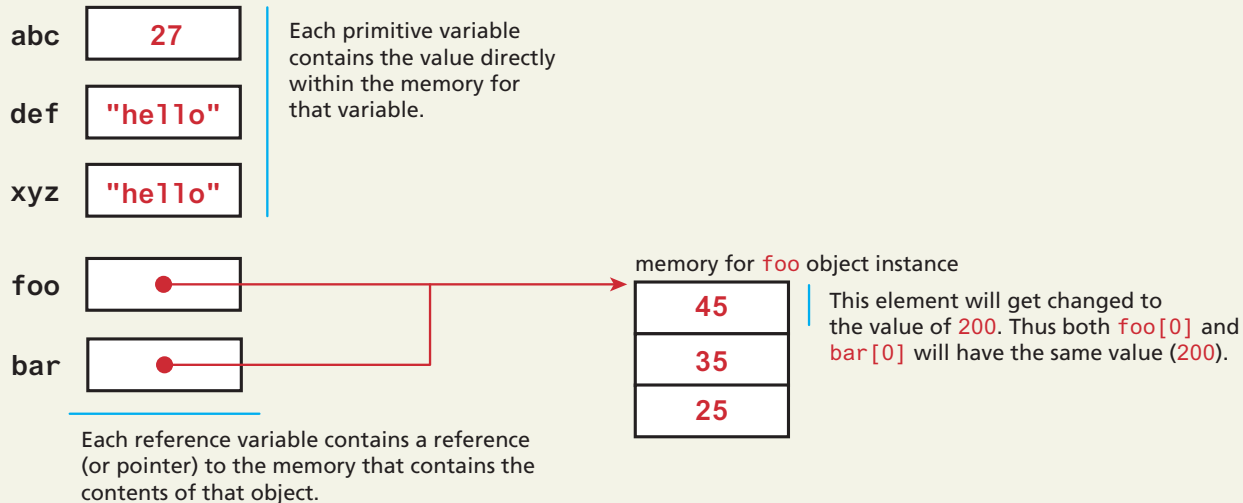

variables with primitive types

variable with reference type
(i.e., array object)

these new variables differ in important ways
(see below)

changes value of the first element of array

Memory representation

5

Conditionals

6

Loops

7

Arrays

8

Objects

JavaScript Output

```
alert("Hello world");
```

JavaScript Output

```
var name = "Randy";
```

```
document.write("<h1>Title</h1>");
```

```
// this uses the concatenate operator (+)
```

```
document.write("Hello " + name + " and welcome");
```

JavaScript Output

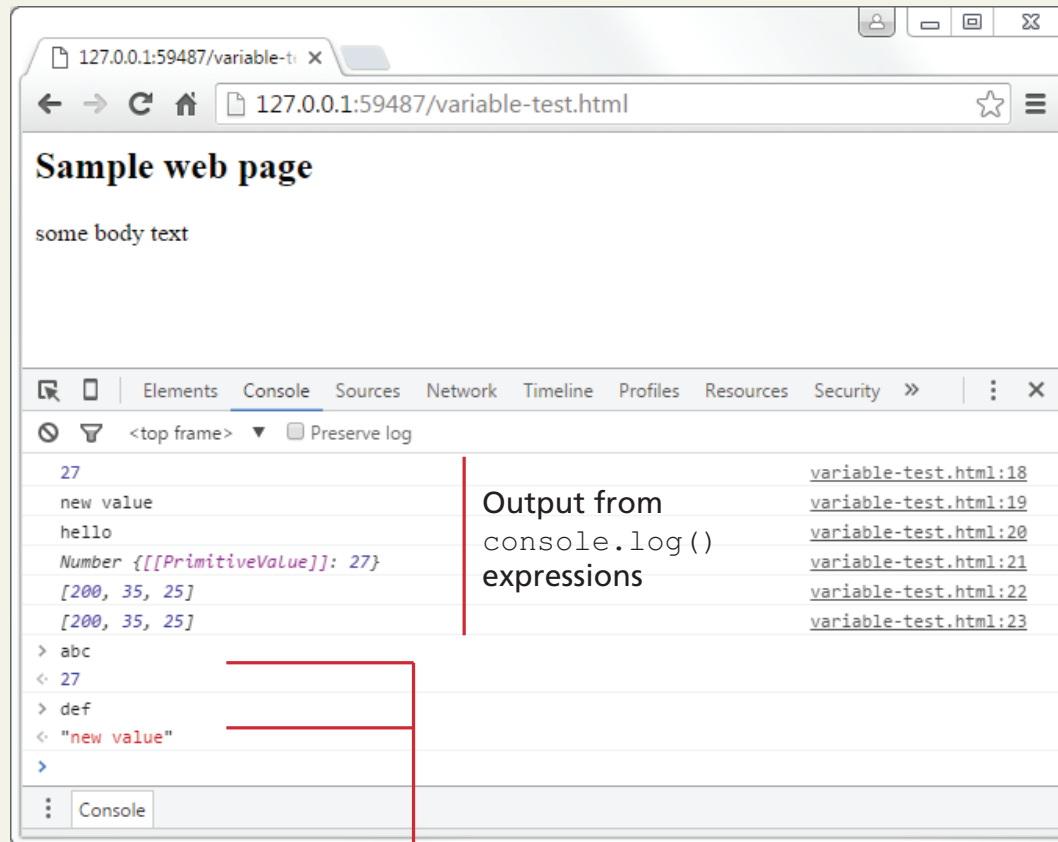

- `alert()` Displays content within a pop-up box.
 - `console.log()` Displays content in the Browser's JavaScript console.
 - `document.write()` Outputs the content (as markup) directly to the HTML document.
-

JavaScript Output

Chrome JavaScript Console

Web page
content

JavaScript
console

Using console interactively to query
value of JavaScript variables

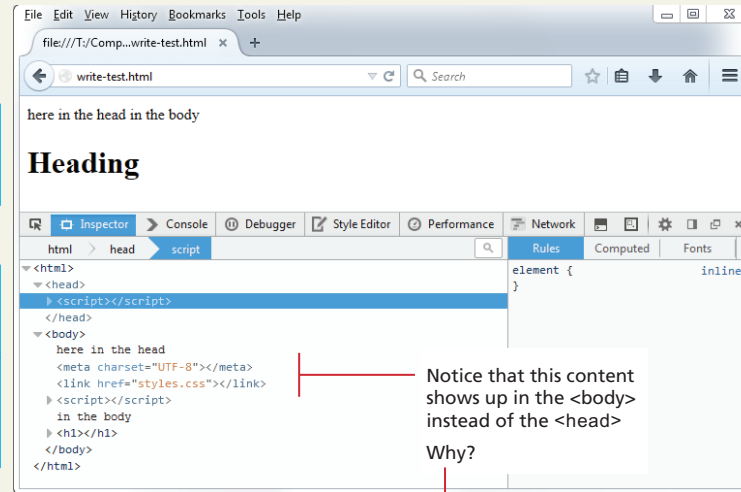

JavaScript Output

Fun with document.write()

```
<html>
<head>
<script>
  document.write('here in the head');
  document.write('<meta charset="UTF-8">');
  document.write('<link href=styles.css>');
</script>
</head>
<body>
<script>
  document.write("in the body");
  document.write("<h1>Heading</h1>");
</script>
</body>
</html>
```

We want this to appear here in the <head>

Generated content

Notice that this content shows up in the <body> instead of the <head> Why?

Browser Inspector displays HTML content that is being displayed (static and dynamic)

The appearance of this line will shift the following write() calls to the <body>

5

Conditionals

6

Loops

7

Arrays

8

Objects

Conditionals

If, else if, else

```
if (hourOfDay > 4 && hourOfDay < 12) {
```

```
    greeting = "Good Morning";
```

```
}
```

```
else if (hourOfDay >= 12 && hourOfDay < 18) {
```

```
    greeting = "Good Afternoon";
```

```
}
```

```
else {
```

```
    greeting = "Good Evening";
```

```
}
```

Conditionals

switch

```
switch (artType) {  
    case "PT":  
        output = "Painting";  
        break;  
    case "SC":  
        output = "Sculpture";  
        break;  
    default:  
        output = "Other";  
}
```

Conditionals

Conditional Assignment

```
/* x conditional assignment */  
x = (y==4) ? "y is 4" : "y is not 4";
```

<u>Condition</u>	<u>Value if true</u>	<u>Value if false</u>
------------------	--------------------------	---------------------------

```
/* equivalent to */  
if (y==4) {  
    x = "y is 4";  
}  
else {  
    x = "y is not 4";  
}
```

Conditionals

Truthy and Falsy

In JavaScript, a value is said to be **truthy** if it translates to true, while a value is said to be **falsy** if it translates to false.

- Almost all values in JavaScript are truthy
 - false, null, "", "", 0, NaN, and undefined are falsy
-

Objects

Loops

While and do . . . while Loops

```
var count = 0;
```

```
while (count < 10) {  
    // do something  
    // ...  
    count++;  
}
```

```
count = 0;
```

```
do {  
    // do something  
    // ...  
    count++;  
} while (count < 10);
```

Loops

For Loops

initialization condition post-loop operation

```
for (var i = 0; i < 10; i++) {  
    // do something with i  
    // ...  
}
```

7

Arrays

8

Objects

Arrays

Arrays are one of the most commonly used data structures in programming.

JavaScript provides two main ways to define an array.

- object literal notation
 - use the `Array()` constructor
-

Arrays

object literal notation

The literal notation approach is generally preferred since it involves less typing, is more readable, and executes a little bit quicker

```
var years = [1855, 1648, 1420];
```

```
var countries = ["Canada", "France",  
                "Germany", "Nigeria",  
                "Thailand", "United States"];
```

```
var mess = [53, "Canada", true, 1420];
```

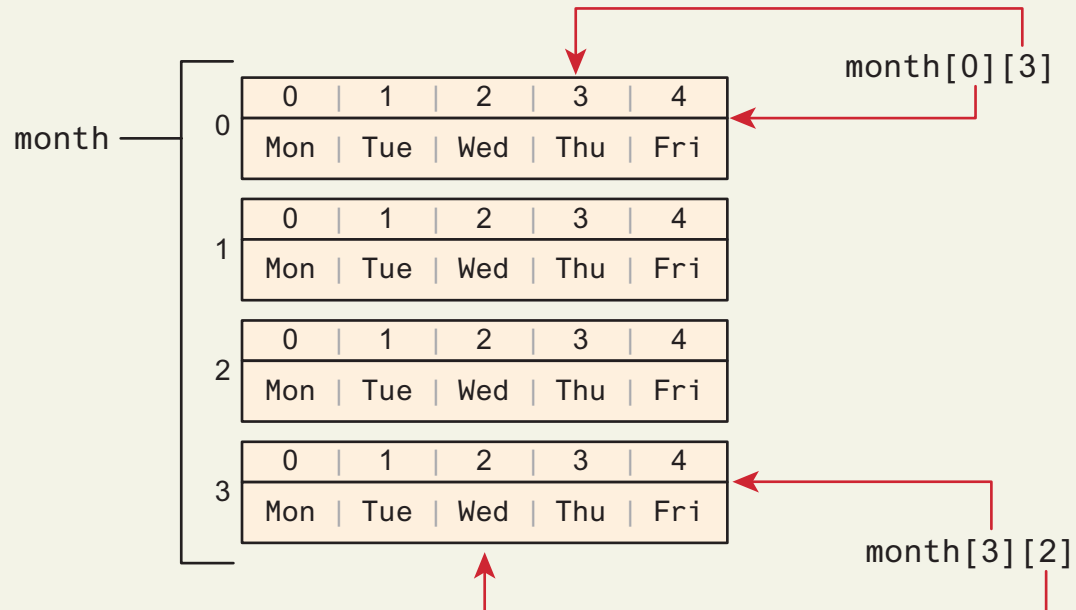

Arrays

Some common features

- arrays in JavaScript are zero indexed
 - [] notation for access
 - .length gives the length of the array
 - .push()
 - .pop()
 - concat(), slice(), join(), reverse(), shift(), and sort()
-

Objects

Objects

Object Creation—Object Literal Notation

```
var objName = {  
    name1: value1,  
    name2: value2,  
    // ...  
    nameN: valueN  
};
```

Objects

Object Creation—Object Literal Notation

Access using either of:

- `objName.name1`
 - `objName["name1"]`
-

Objects

Object Creation—Constructed Form

// first create an empty object

```
var objName = new Object();
```

// then define properties for this object

```
objName.name1 = value1;
```

```
objName.name2 = value2;
```

Chapter 8 cont.

9

Functions

10

Object
Prototypes

11

Summary

Functions

Function Declarations vs. Function Expressions

Functions are the building block for modular code in JavaScript.

```
function subtotal(price,quantity) {  
    return price * quantity;  
}
```

The above is formally called a **function declaration**, called or invoked by using the () operator

```
var result = subtotal(10,2);
```

Functions

Function Declarations vs. Function Expressions

// defines a function using a function expression

```
var sub = function  
  subtotal(price,quantity) {  
    return price * quantity;  
  };
```

// invokes the function

```
var result = sub(10,2);
```

It is conventional to leave out the function name in function expressions

Functions

Anonymous Function Expressions

// defines a function using an anonymous function expression

```
var calculateSubtotal = function (price,quantity) {  
    return price * quantity;  
};
```

// invokes the function

```
var result = calculateSubtotal(10,2);
```

Functions

Nested Functions

```
function calculateTotal(price,quantity) {  
    var subtotal = price * quantity;  
    return subtotal + calculateTax(subtotal);  
    // this function is nested  
    function calculateTax(subtotal) {  
        var taxRate = 0.05;  
        var tax = subtotal * taxRate;  
        return tax;  
    }  
}
```

Functions

Hoisting in JavaScript

Function declaration is **hoisted** to the beginning of its scope

```
function calculateTotal(price,quantity) {  
  var subtotal = price * quantity;  
  return subtotal + calculateTax(subtotal);  
  
  function calculateTax(subtotal) {  
    var taxRate = 0.05;  
    var tax = subtotal * taxRate;  
    return tax;  
  }  
}
```

Variable declaration is hoisted to the beginning of its scope

BUT
Variable assignment is **not** hoisted

```
function calculateTotal(price,quantity) {  
  var subtotal = price * quantity;  
  return subtotal + calculateTax(subtotal);  
  
  var calculateTax = function (subtotal) {  
    var taxRate = 0.05;  
    var tax = subtotal * taxRate;  
    return tax;  
  };  
}
```

THUS
The value of the calculateTax variable here is **undefined**

Functions

Callback Functions

```
var calculateTotal = function (price, quantity, tax) {  
  var subtotal = price * quantity;  
  return subtotal + tax(subtotal);  
};
```

2

The local parameter variable `tax` is a reference to the `calcTax()` function

```
var calcTax = function (subtotal) {  
  var taxRate = 0.05;  
  var tax = subtotal * taxRate;  
  return tax;  
};
```

1

Passing the `calcTax()` function object as a parameter

We can say that `calcTax` variable here is a **callback function**

```
var temp = calculateTotal(50, 2, calcTax);
```

Functions

Callback Functions

```
var temp = calculateTotal( 50, 2,
```

Passing an **anonymous function** definition
as a callback function parameter

```
function (subtotal) {  
    var taxRate = 0.05;  
    var tax = subtotal * taxRate;  
    return tax;  
}
```

```
);
```

Functions

Objects and Functions Together

The diagram illustrates the relationship between a variable and its nested objects and functions. A blue line with arrows starts from the left and points to the `var order = {` line. From there, it branches to point to the `product` object and the `customer` object. It also points to the `output` function within the `product` object and the `output` function at the bottom of the `order` object. The `this` keyword in the function return statements is underlined.

```
var order = {  
  salesDate : "May 5, 2017",  
  product : {  
    type: "laptop",  
    price: 500.00,  
    output: function () {  
      return this.type + ' $' + this.price;  
    }  
  },  
  customer : {  
    name: "Sue Smith",  
    address: "123 Somewhere St",  
    output: function () {  
      return this.name + ', ' + this.address;  
    }  
  },  
  output: function () {  
    return 'Date' + this.salesDate;  
  }  
};
```

Functions

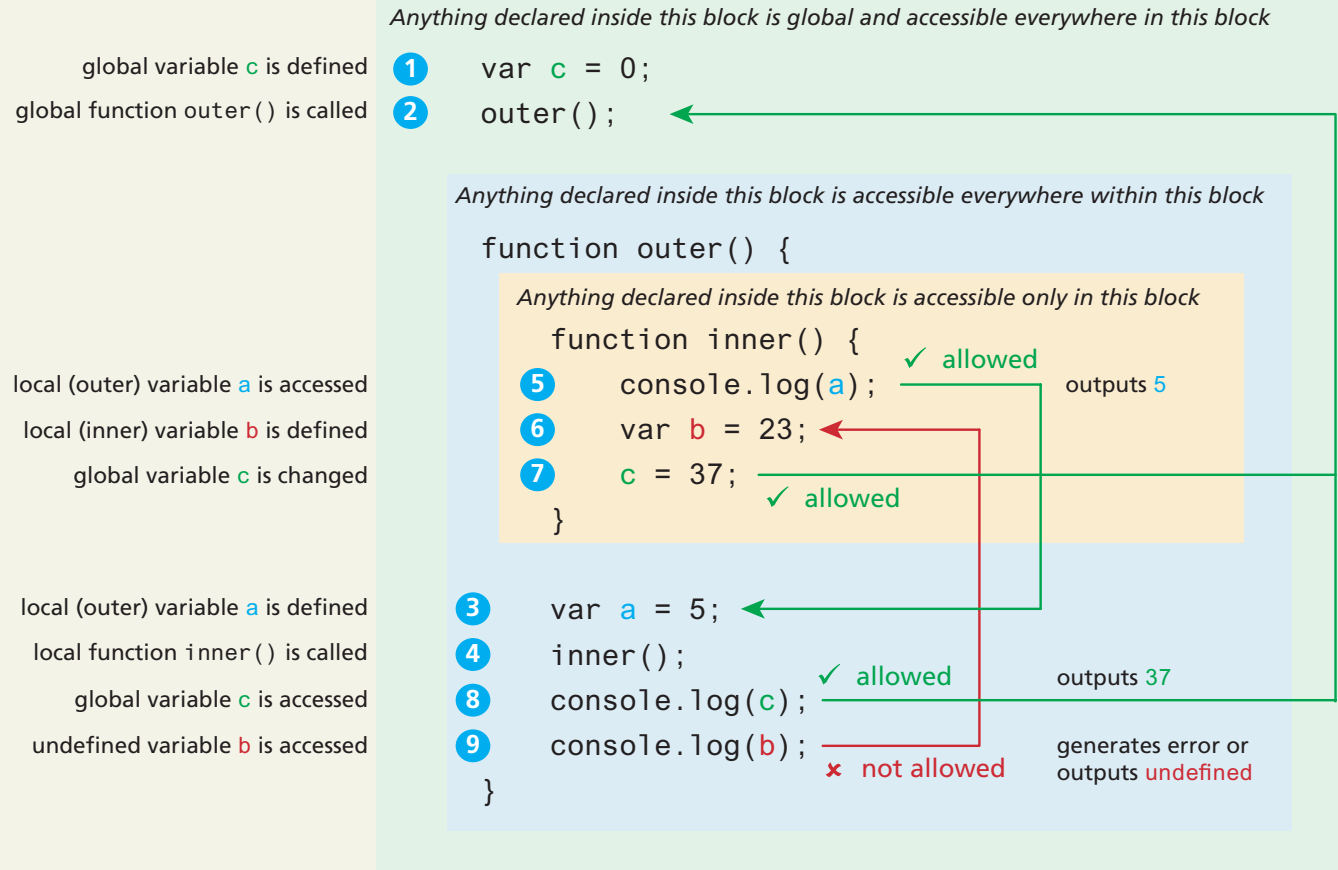

Scope in JavaScript

Each function is like a box with a one-way window

Functions

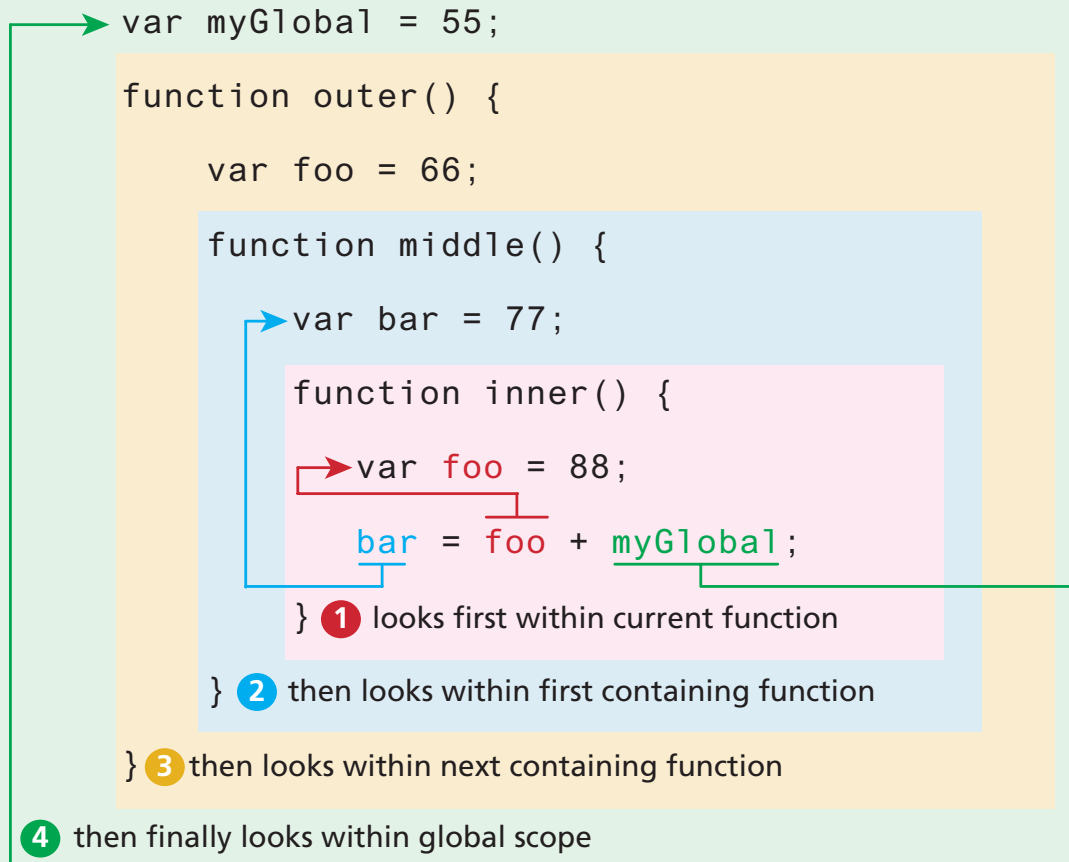

Scope in JavaScript

Functions

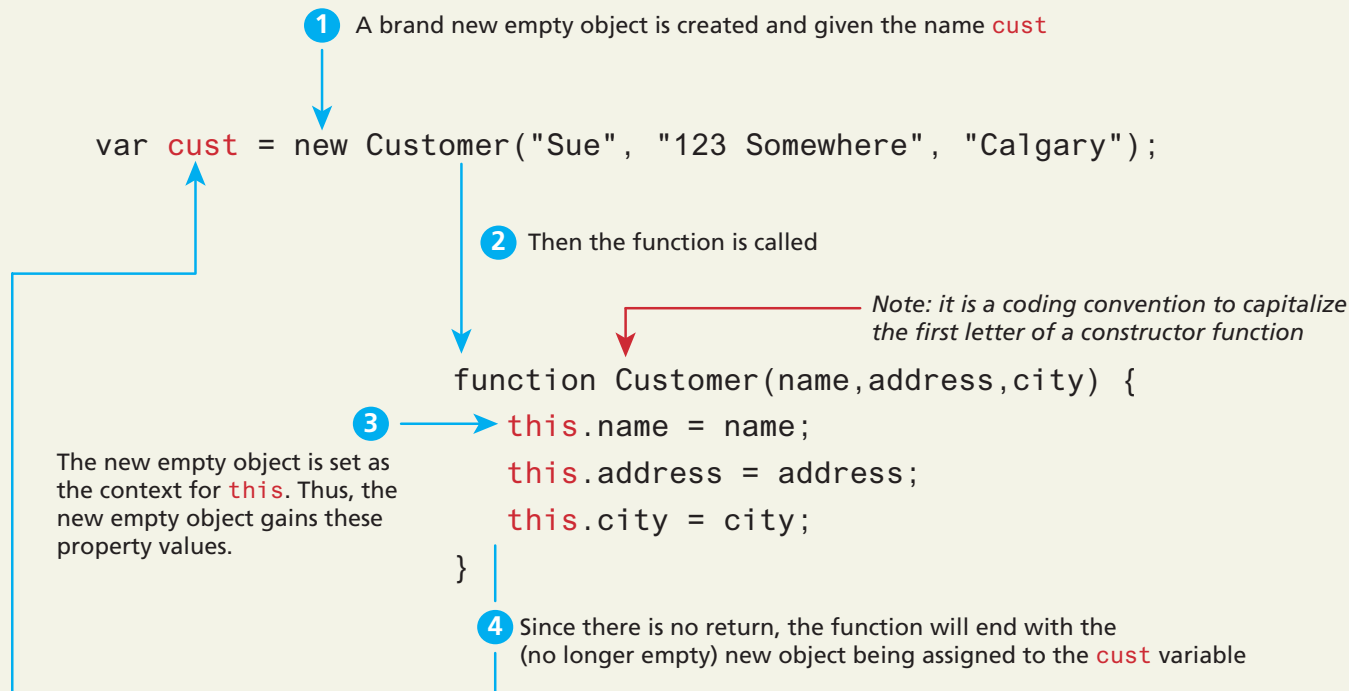

Scope in JavaScript

Remember that scope is determined at design-time

Functions

Function Constructors

Chapter 8 cont.

9

Functions

10

Object
Prototypes

11

Summary

Object Prototypes

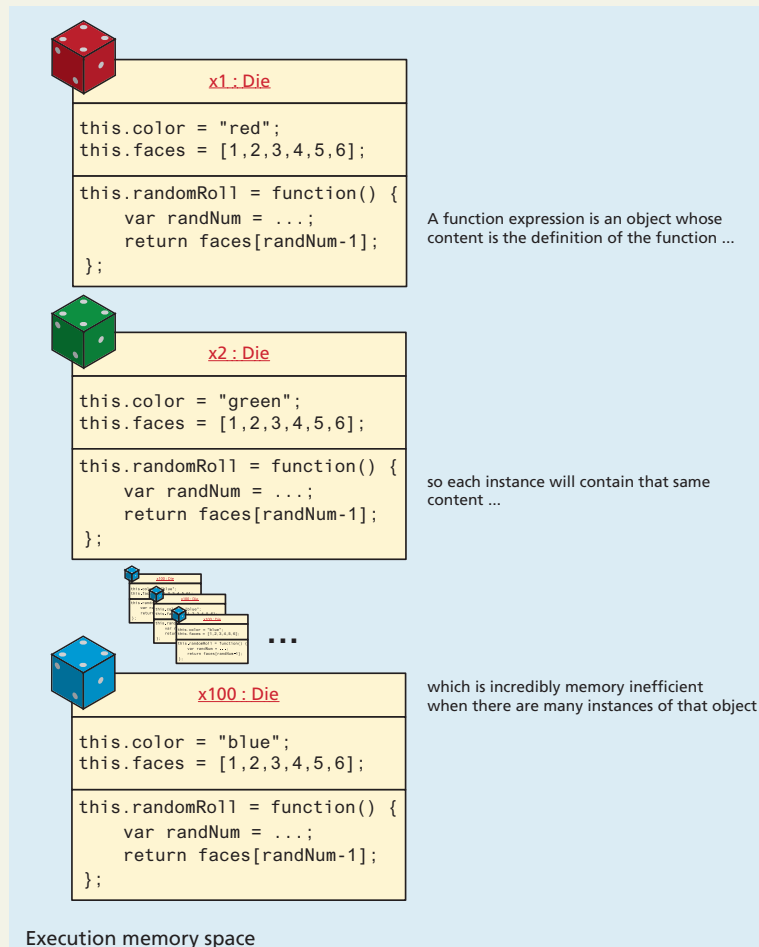

There's a better way

While the constructor function is simple to use, it can be an inefficient approach for objects that contain methods.

Prototypes are an essential syntax mechanism in JavaScript, and are used to make JavaScript behave more like an object-oriented language.

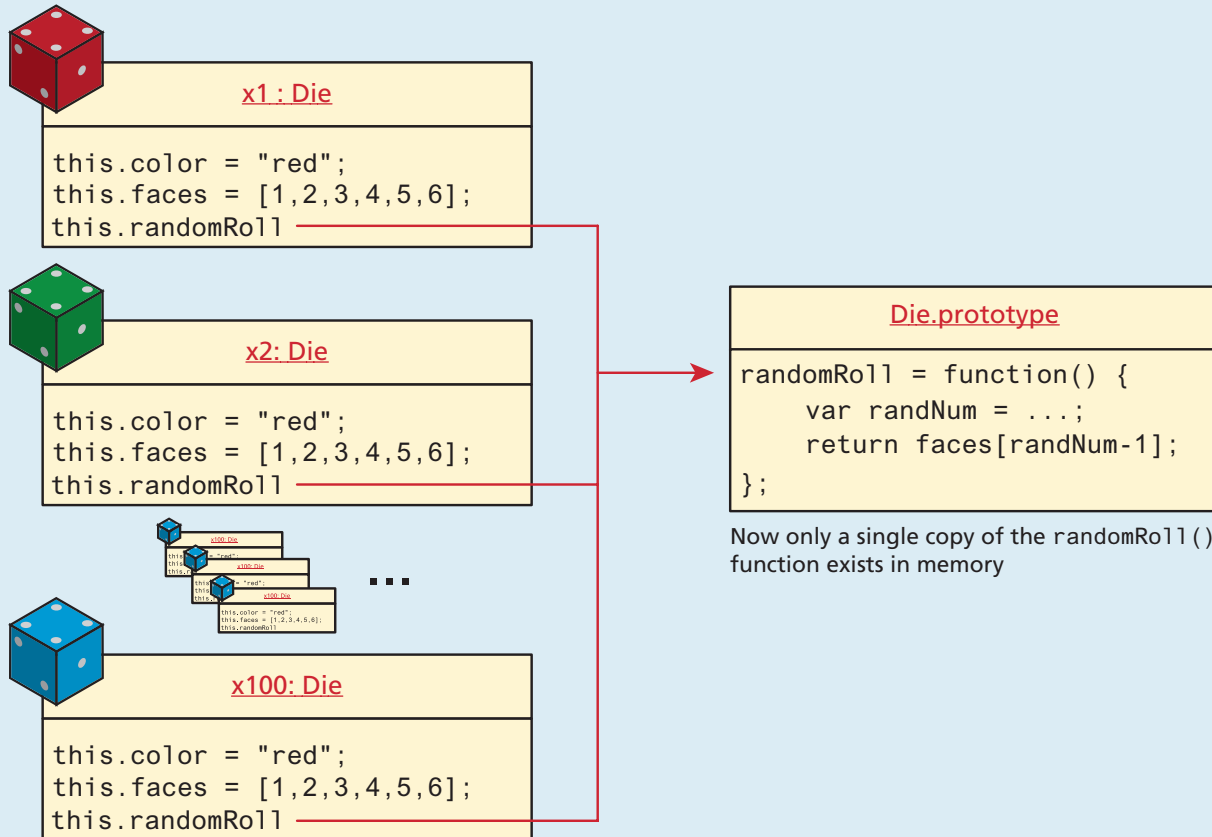

Object Prototypes

Methods get duplicated...

Object Prototypes

Using Prototypes reduces duplication at run time.

Execution memory space

Object Prototypes

Using Prototypes to Extend Other Objects

```
String.prototype.countChars = function (c) {  
    var count=0;  
    for (var i=0;i<this.length;i++) {  
        if (this.charAt(i) == c)  
            count++;  
    }  
    return count;  
}  
  
var msg = "Hello World";  
console.log(msg + "has" + msg.countChars("l") + " letter l's");
```
